MARKET COMMENTARY

DCE iron ore futures tight by 1.41% , the main contract closed 719. The spot quotation in the morning almost kept steady. some traders were active to sell, steel mills purchased on demand. today's overall market transaction atmosphere in general. PBF at Shandong port dealt 815-828 yuan/mt, the same as yesterday; SSF at Shandong port dealt 515 yuan/mt, the same as yesterday; Stocks at 35 ports tracked by SMM totalled 151.81 million tonnes, down slightly by 260,000 tonnes month-on-week. In addition, the average daily port opening volume increased by 30,000 tons to 2.87 million tons, which led to a decrease in the port stock of imported ore. Considering that some steel mills after the completion of last year's output reduction target, coupled with the replenishment plan before the Spring Festival, the recent port spot procurement enthusiasm significantly increased, next week's average daily port volume is expected to continue to increase, thus driving port inventory is expected to continue to decline. Iron ore supply pressure slightly eased, give some support to the price of iron ore, iron ore prices are expected to continue to be strong shock.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
