MARKET COMMENTARY

DCE iron ore futures opened shock run, the main contract 2209 closed at 892.5, up 2.06% throughout the day. Traders are enthusiastic about shipping, steel mills are on the sidelines, and the market transaction atmosphere is cold. The transaction price of PBF in Shandong is concentrated in 975-990 yuan /mt, up 5-15 yuan /mt from yesterday's price, and the transaction price of super special powder in Shandong is 790 yuan / mt, increase 18 yuan /mt from yesterday's price. The transaction price of PB powder in Tangshan area is 975-980 yuan / mt, increase of 10-15 yuan / mt from yesterday's price. According to SMM tracking data, a total of 81 ships arrived at China's major ports from 5.23 to 5.29 days, and the arrival volume is expected to be 12.52 million tons, and the arrival volume is 390,000 tons lower than the previous period, an increase of 48,000 tons over the same period last year. During the period, Australian shipments increased by 1.04 million tonnes to 19.83 million tonnes, an increase of 4.27 million tonnes from the same period last year, while Brazilian shipments shipments decreased by 890,000 tonnes to 6.04 million tonnes in the current period, a decrease of 280,000 tonnes from the same period last year. Imported mine arrivals in the current period decreased slightly sequentially, while shipments to Australia and Brazil increased slightly. Shipments to Australia continue to increase significantly. However, Shipments from Brazil have declined, and there is still room for iron ore shipments overseas. At present, the demand for iron ore is stable and increasing, and steel mills have not reduced production due to losses and high inventories, and ore prices have strong support. However, considering the inflated or policy intervention of ore prices, it is expected that mineral prices will continue to operate in a wide range in the short term.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
