IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Jul 10th, 2026		CFR Qingdao, USD/dry tonne							Today, the DCE iron ore futures trended weaker today, with contract i2609 closing at 751.5 yuan/mt, up 0.87% from the previous trading day. Port spot prices rose 2-5 yuan/mt from the prior trading day. Trader activity was moderate, and steel mills mainly purchased for essential restocking. As of now, spot trading volumes were moderate. SMM's latest statistics showed that total iron ore inventory at 35 main ports nationwide was 147.16 million mt, down 1.14 million mt WoW. Over the same period, the daily average port pick-up volume edged down by 23,000 mt to 3.275 million mt. This week, affected by typhoons and persistent rainy weather, port operations were disrupted, vessel berthing and unloading efficiency dropped significantly, and port congestion intensified. On the demand side, as hot metal production of steel mill blast furnaces continued to decline, the daily average port pick-up volume pulled back slightly. With increasing blast furnace maintenance at steel mills, hot metal production is still expected to decline further. Therefore, from a fundamental perspective, short-term support for iron ore prices is expected to continue weakening.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
