MARKET COMMENTARY

DCE iron ore was shocked and keep downward all the day. The main contract closed at 678.5,decreased of 3.96 %. Traders are no more motivated to ship. Steel mills are mainly on the sidelines, and market turnover continues to pick up. PBF at Shandong port dealt 730-740yuan/mt, decrease 10-15yuan/ mt than yesterday. PBF at Tangshan dealt 745 yuan/mt, keep stable compare with yesterday. According to the inventory data of the top ten ports tracked by SMM, the total inventory of the top ten ports this week increased slightly by 0.6% month on month to 90.1 million tons. Since the beginning of July, the current top ten ports have been accumulated in the seventh phase. At present, the downstream demand is affected by high temperature and limited production, which slows down the resumption of production of the steel plant. The optimistic expectation of the market for the approaching peak season has weakened, resulting in the steel plant being cautious in purchasing. However, at present, the production of molten iron has increased month on month this week, and the demand side is still supported. It is expected that there is limited room for the decline of the ore price, and the subsequent iron ore price may be dominated by a

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
