IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Jun 8th, 2026		CFR Qingdao, USD/dry tonne							Today, DCE iron ore futures trended weak, with the most-traded contract i2609 eventually closing at 759 yuan/mt, down 0.78% from the previous trading day. Port spot prices fell 5 yuan/mt from the prior day. Traders acted in line with the market, with moderate quoting activity; steel mills mainly made need-based restocking purchases, with few inquiries; as of now, spot transaction volumes were moderate. Shipping data shows that China's iron ore supply has entered a loose phase, and iron ore prices will gradually come under pressure. According to SMM data, total global iron ore shipment volume last week fell 3.88% WoW to 33.8317 million mt, and total iron ore arrivals into China rose 2% WoW to 27.54 million mt. Meanwhile, the decline in port pick-up volumes also indicates that steel mills' demand for iron ore is starting to slow down. With coking coal and coke price rise expectations still in place, even if hot metal prices remain high, steel mills' acceptance of iron ore prices is relatively tight, making ore prices overall more likely to fall than rise. In the short term, iron ore prices may continue to be under pressure, showing a weak trend overall.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
