MARKET COMMENTARY

Today, Dalian iron ore futures continued to hold up well, with the most-traded contract I2509 closing at 764, up 1.8% for the day, though the increase narrowed significantly. Traders followed the market trend. As the weekend approached and steel mills remained cautious amid high prices, inquiry volumes decreased. The market transaction atmosphere was relatively ordinary. In the Shandong region, the mid-stream transaction prices of PB fines were around 748-750 yuan/mt, up 2-3 yuan/mt from yesterday. In the Tangshan region, the transaction prices of PB fines were around 763-765 yuan/mt, also up 2-3 yuan/mt from yesterday. As of July 11, SMM data showed that the total inventory of iron ore at 35 ports nationwide was 136.16 million mt, a decrease of 970,000 mt WoW. The daily average port pick-up volume of imported ore was 2.992 million mt, a decrease of 23,000 mt WoW. Ports continued destocking, and the resilient demand for iron ore provided support for ore prices. Considering the rapid increase in ore prices this week, there was a certain fear of high prices in the market; however, with strong fundamental support, a downward trend was unlikely. It is expected that ore prices may fluctuate at highs next week.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
