MARKET COMMENTARY

Today, the DCE iron ore futures showed an N-shaped trend today. The most-traded contract I2609 ultimately closed at 786 yuan/mt, with no change from the previous closing price. Spot prices remained stable compared to the previous day as of now. Traders were active in quoting, while steel mills made fewer inquiries; overall spot cargo trading was sluggish.Last week, according to SMM statistics, global iron ore shipments reached 32.27 million mt, up only 2% from the previous period. Meanwhile, China's iron ore port arrivals reached 24.31 million mt, surging 4.11 million mt (20%) WoW. Shipments from Brazil and Australia showed clear signs of recovery from the impact of weather factors in the prior period. Therefore, in the short term, there is some room for growth on the supply side, which exerts downward pressure on iron ore prices given that inventory remains at a relatively high level. With expectations that hot metal production will stay high, ore prices may fluctuate at highs in the short term.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
