MARKET COMMENTARY

DCE iron ore was was shocked and continued upward all the day.The main contract closed at 749.5,decreased of 2.46%. Traders are not very enthusiastic about shipments, steel mills are mainly on the sidelines, and there are few transactions in the market.PBF at Shandong port dealt 770-800yuan/mt,increased 10 yuan/mt than yesterday. PBF at Tangshan port dealt 785-795 yuan/mt. Since last week, some steel mills have stopped production for maintenance, resulting in a decline in steel production. Today's steel inventory data shows that steel demand has improved slightly, the pessimism of black series has eased, and iron ore prices have begun to rebound. However, according to SMM research, the blast furnace operating rate this week was 79.23%, down 2.11% from the previous week. And today there are still many steel mills reporting that they will be overhauled next week, and the demand for iron ore will continue to decline. The arrivals to ports will still increase next week, the decline rate of port inventories will continue to narrow, and the ore price will be under pressure to rise without sufficient motivation. It is expected that the iron ore price will fluctuate.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
