MARKET COMMENTARY

Today, Dalian Iron Ore futures opened low and closed high, holding up well throughout the day. The most-traded contract I2509 eventually closed at 733, with a daily increase of 0.14%. Traders sold goods according to market conditions. Steel mills purchased as needed. The market transaction atmosphere was good. In the Shandong region, the mainstream transaction prices of PB fines were around 723-724 yuan/mt, up 2-3 yuan/mt from yesterday's prices. In the Tangshan region, the transaction prices of PB fines were around 733-735 yuan/mt, up 0-3 yuan/mt from yesterday's prices. The market's pessimistic sentiment regarding tariffs has eased somewhat. Despite recent rumors of production restrictions, the actual impact has been limited. SMM data shows that the impact from blast furnace maintenance this week only increased by 30,700 mt MoM to 1.1845 million mt, with a limited decline in pig iron production. Coupled with a significant contraction in short-term iron ore supply, the weak supply-demand pattern has instead supported a rebound in ore prices. Subsequent attention should be focused on changes in demand for finished steel products and inventory accumulation during the off-season.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
