GEOGRAPHICAL INDEX

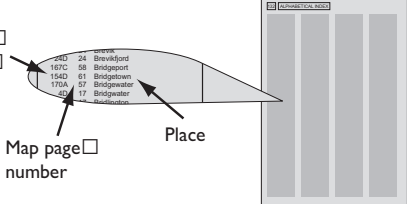

This index helps you find ports and places according to their geographic proximity. The index begins with London, and follows the coastlines of the world in a spiral, incorporating all islands and ending in Canada. The world map below shows the route this index takes.

The geographical index gives detailed information for all port facilities, as well as the latitude and longitude (latitude for North and South of the equator, and longitude for East and West of the Greenwich Meridian Line).

The geographical index is arranged in columns which are divided into four sections, marked A-D. The column/section reference is used by the alphabetical index to cross-refer to the correct listing in the geographical index (see below).

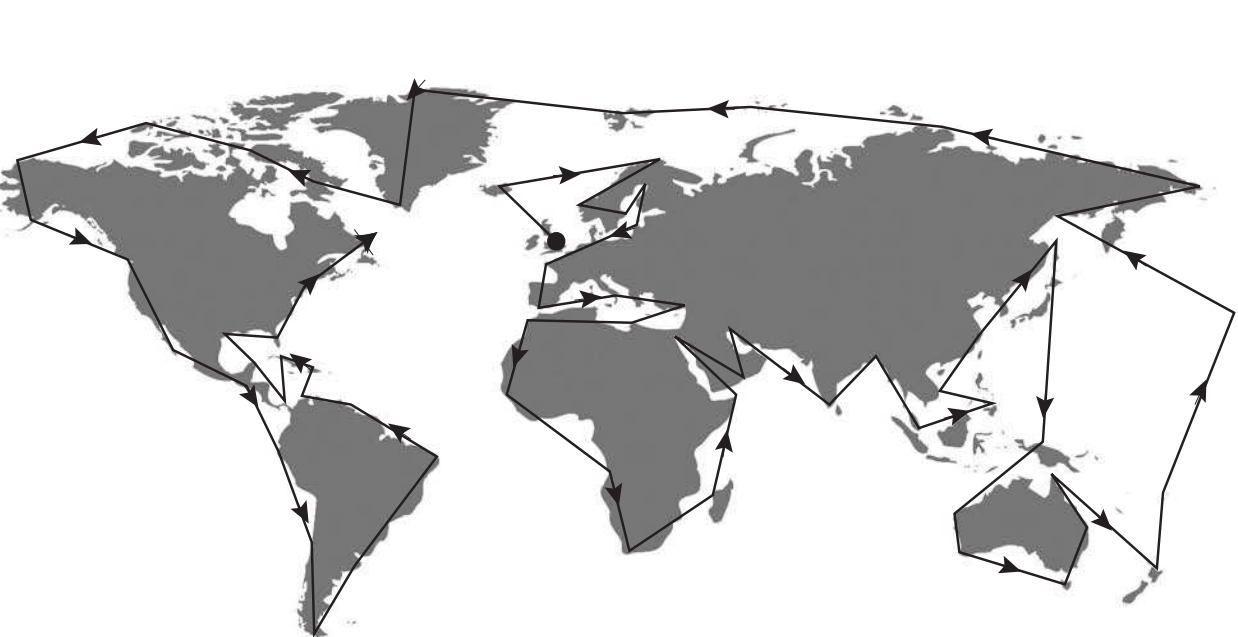

Cross-reference to the geographical index, column 154, section D

ALPHABETICAL INDEX

Look up a place in the Alphabetical Index. This will show the column and section reference to the listing in the geo index. It also shows the page number to the map on which the place is featured.

GLOSSARY

Beam Overall vessel width.

Draught Vertical distance between a vessel's lowest point and adjacent sea level.

Air Draught Vertical distance between a vessel's highest point and adjacent sea level.

Seasonal Draught Variations in draught according to season and geographical region.

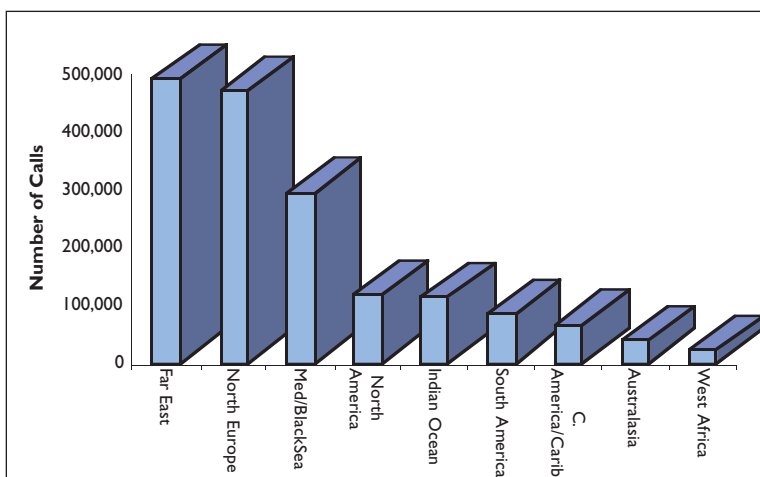

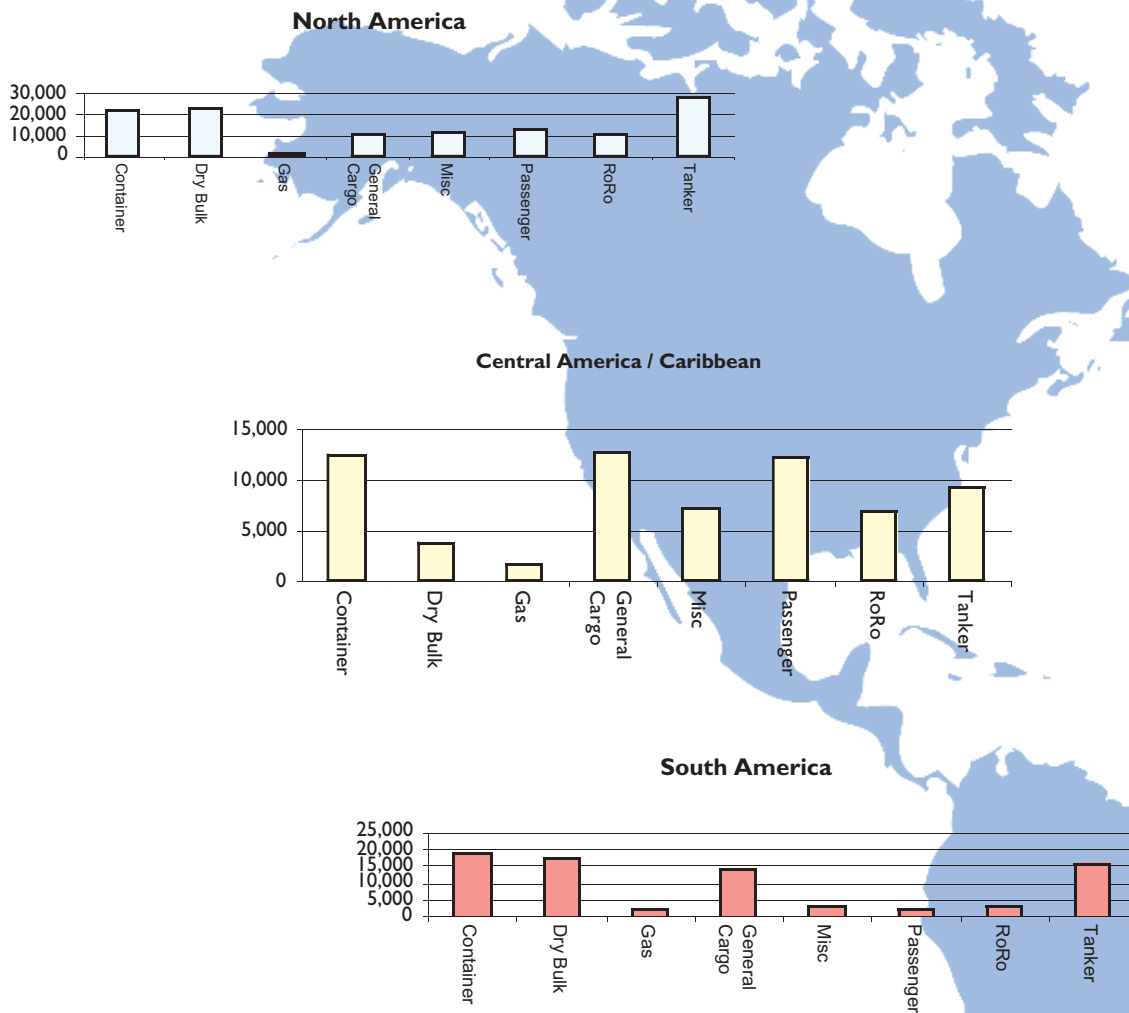

Elevation Height above mean sea level.

Ports in **bold type** on regional distance tables are included on the World Distance Table. All distances are in Nautical Miles, except on Fact Panels where kilometres are also provided where relevant.

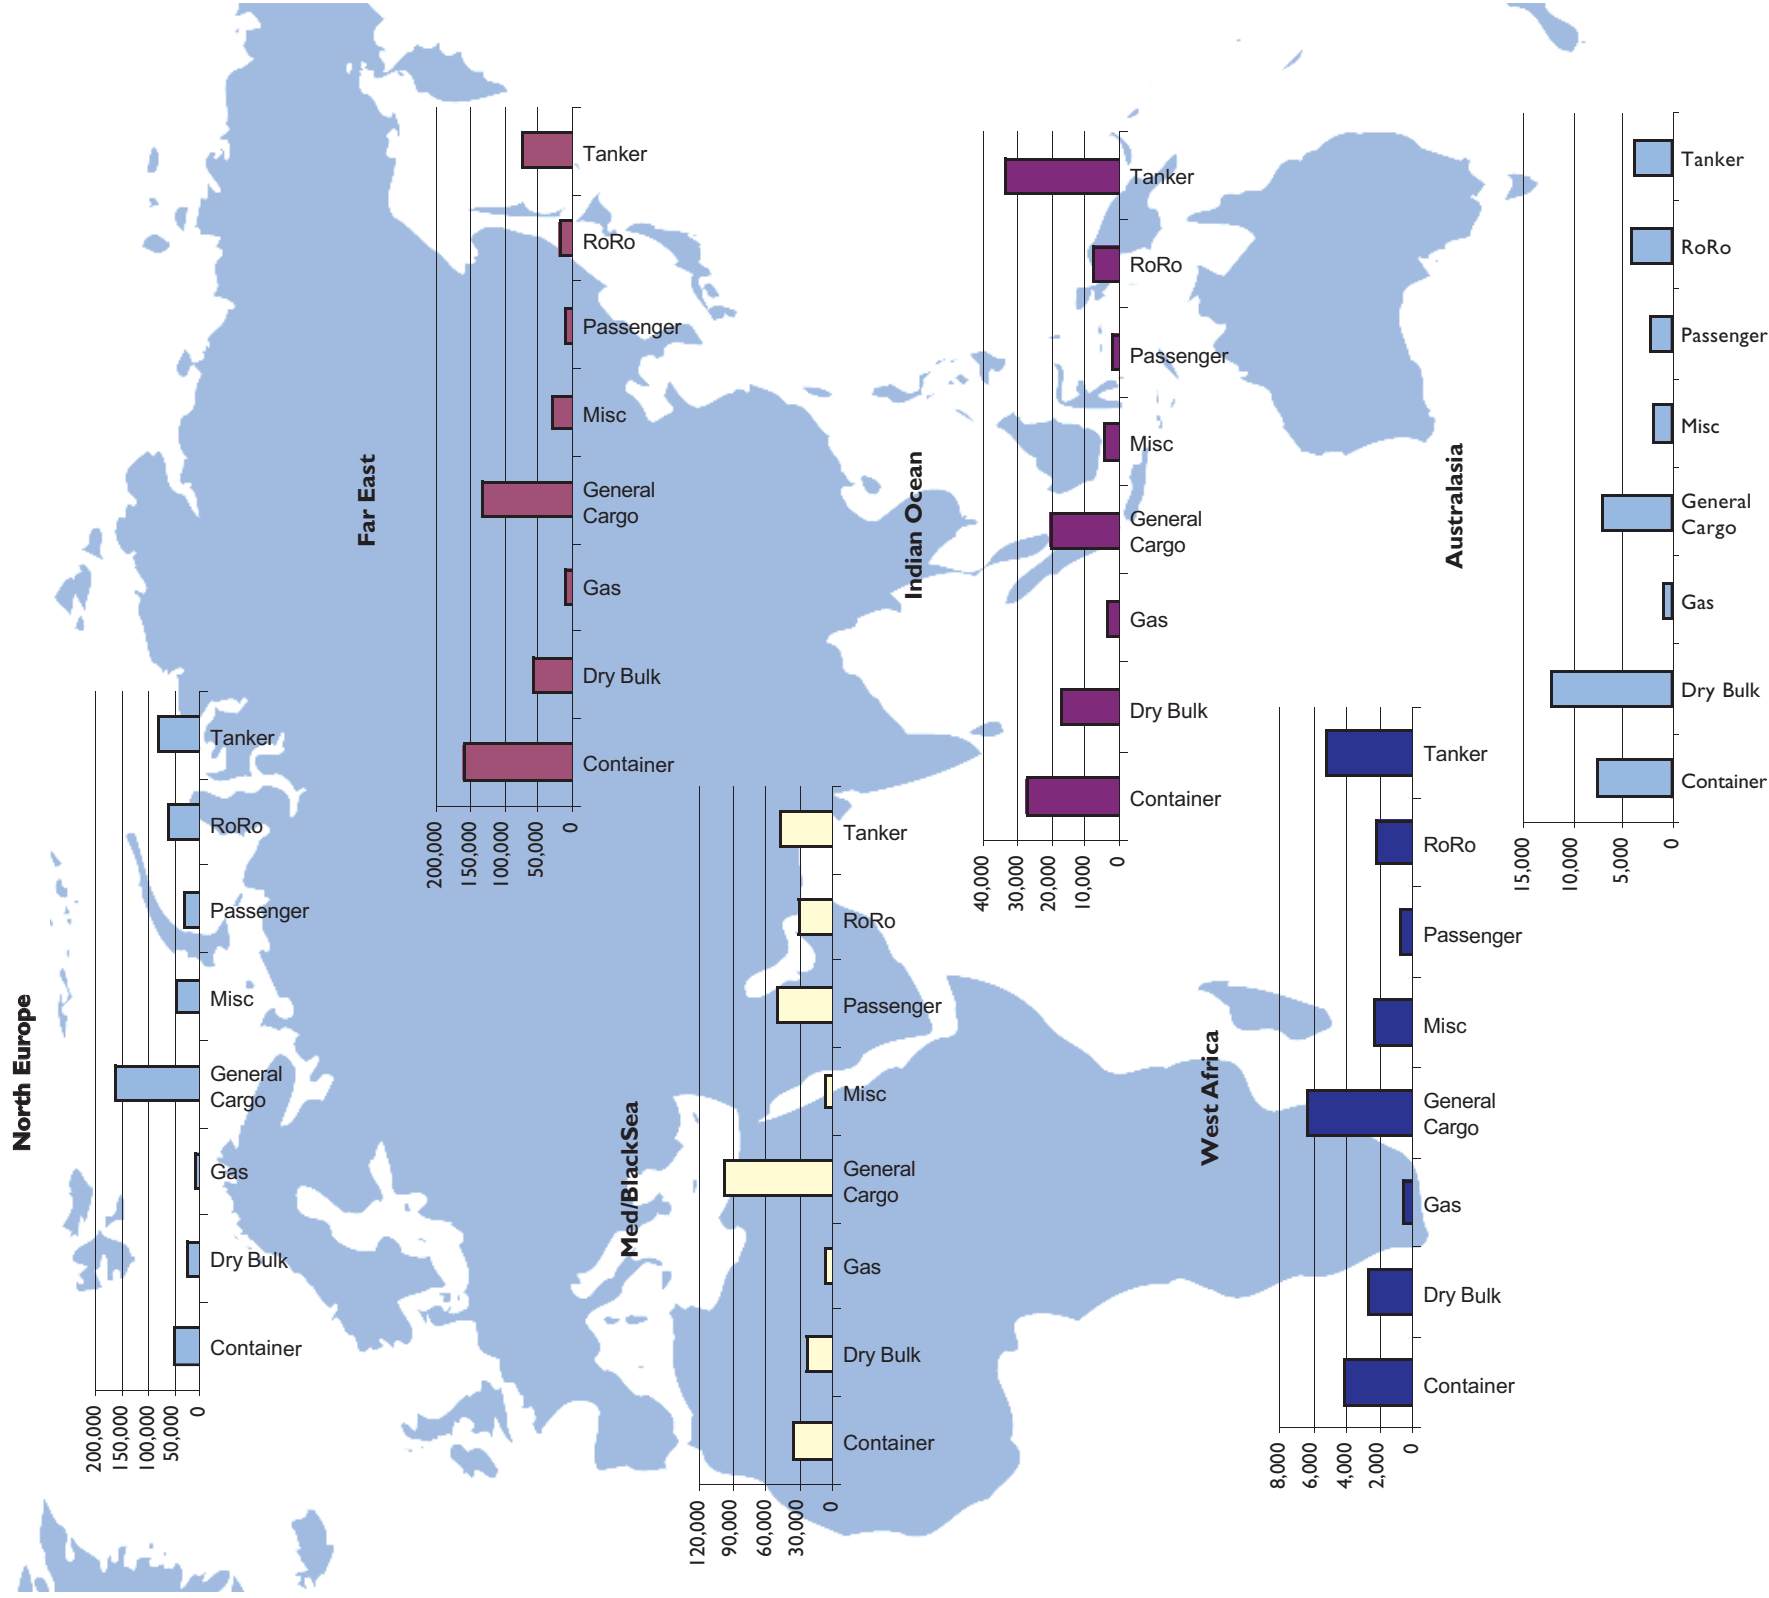

Scale varies between each individual map and is indicated on the appropriate scale bar.

Lloyd's MIU Consultancy has compiled the following global statistics, examining the movements of the merchant fleet and detailing some findings by vessel category where significant. The data is sourced from the Lloyd's MIU database. For any statistical or research enquiries please email enquiries@lloydsniu.com

THE SHOREBASED USE OF AIS

Whilst only just over two years have passed since the carriage of AIS became mandatory for ships to which Ch V of SOLAS applies, things have moved a long way in the use of AIS ashore.

Unfettered by the presentational restrictions that have necessarily been imposed on the display of AIS in ships, the more flexible IALA guidelines for the presentation of AIS data has resulted in more imaginative solutions being offered by equipment providers. A significant number of VTS Centres now have AIS integrated into their traffic image displays. Some centres fuse AIS on a radar display but a growing majority fuse AIS and radar on a traffic image display that is backed by an Electronic Chart System (ECS).

So what advantages has AIS brought to shore stations? Whilst a few centres have reported a reduction in VHF communications, the most significant benefit has been a dramatic improvement in the accuracy of tracking and confidence in the identification of tracks. When properly displayed, AIS can also improve the spatial awareness of VTS Operators through the presentation of dynamic data such as heading and rate of turn, and through the accurate presentation of ship dimensions in the close passing situations that are prevalent in the port environment (see example graphics). An AIS base station will generally see further than a co-located radar. This can offer the benefit of advanced warning for planning and pilot allocation. It can also provide the ability

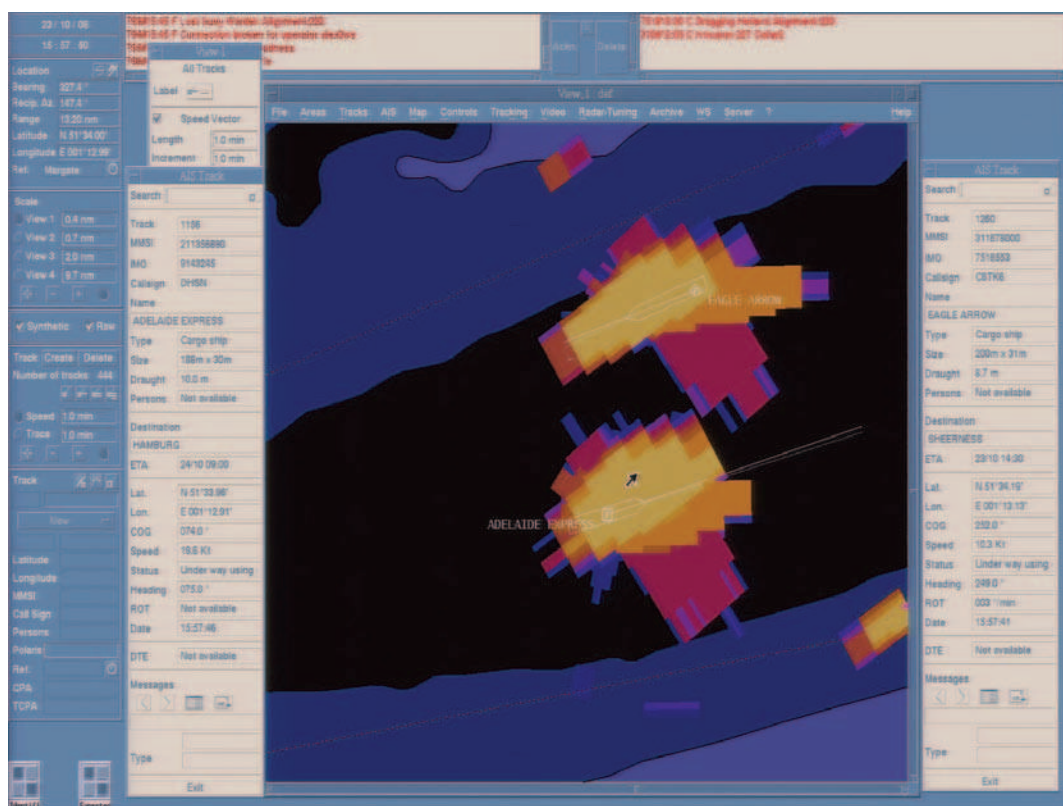

Example of AIS alone with radar video inhibited

to look into dock systems, under bridges and into channels where there would otherwise be a radar blind spot, but in such circumstances it should be used for vessel monitoring and traffic organisation rather than navigational assistance.

To a degree AIS has been a victim of its own success. Its accelerated introduction resulted in the acceptance of the Minimum Keyboard Display (MKD) onboard ship; its tabular presentation is of much reduced benefit to the mariner compared with a graphical display. Although some vessels are fitted with a graphical display, the majority rely on MKD. With its poor interface for data input, errors can be introduced that have the potential to confuse the unwary. Early teething problems were not unexpected but the situation is now much improved.

Errors in the static message are now relatively infrequent and the introduction in some VTS Centres of comparisons between data sources to validate AIS identity fields will help reduce this still further. Voyage related messages rely on operator update and are more prone to errors - perhaps due to the MKD, but arguably such errors impact little on navigational safety. Errors in the dynamic message are becoming less and less frequent with the most common being the transmission of an offset heading due to the misalignment of the gyro input signal with the AIS transponder. Whilst anecdotal reports suggest the incidence of erroneous

Examples with radar video overlaid with AIS

AIS messages are still as high as 30%, VTS Centres with accurate records indicate that the incidence of AIS errors of navigational significance that are not immediately corrected is probably nearer 1% or less.

Clearly any level of error is unacceptable if AIS is used as the sole source of information and for this reason AIS needs to be validated in the port environment if it is to be used for the provision of a navigational assistance service, or in the organisation of traffic where it involves the management of navigational safety. There are many reasons why a VTS Centre would not consider decommissioning existing radars and placing reliance for coverage solely on AIS at this early stage. However, AIS may allow a VTS to extend its area of influence and there are examples of AIS being introduced for non-SOLAS vessels in the inland and river environment where radar coverage may be impractical.

The messaging features of AIS are not widely used at present but early examples include the transmission of tidal data and security related information. As users become more familiar with the system and its capabilities, it is likely that AIS messaging will be used more widely for the dissemination of routine information that must otherwise be passed by voice over VHF.

In sum, the use of AIS ashore has provided a quantum enhancement of VTS capability. Whilst it may extend the horizon and the ability to monitor traffic at extended ranges or in confined areas, AIS should be seen as another sensor. Properly correlated, AIS provides the maritime world with the sort of additional track data, and more, that the air world has enjoyed for decades.

A SEAMAN'S PERSPECTIVE - THE ROLE OF AIS ON THE BRIDGE AT SEA

Life at sea has changed immeasurably over recent years, and the advances in equipment have come thick and fast. This technological progress has been relentless, touching every facet of the ship-to-shore relationship, and spanning almost every shipboard activity.

Many initiatives have made routine tasks simpler, while others have changed forever the way watch-keepers operate and the very safety and processes of navigation itself.

One of the most fundamental changes has been the introduction of Automatic Identification Systems (AIS) for vessels. AIS brings to the seafarer many benefits, principal amongst these is the automatic and immediate provision of vessel identity, thereby facilitating rapid radio communication where necessary, no longer do nameless ships simply pass in the night.

There are other advantages of AIS over existing navigation equipment, and the systems provide precise navigational advice over a wide geographical coverage. AIS offers real-time maneuvering data and a high level of traffic image accuracy, and all without the effect of the weather on tracking performance, and with the absence of "radar shadow" areas. Advantages that provide a real boost to the officers on the bridge, as they no longer struggle to adjust sets for rain and sea clutter.

AIS has changed not just the reactions and procedures of the navigators using it, but has affected the provision of assistance to them – whether from other vessels or port Vessel Traffic Services (VTS) operators. The provision of navigation data is now a complete closed loop, with all parties provided with the information they need, when they need it.

While there are numerous benefits gained from the new equipment, we must never become complacent, and must always remember that professional navigators still have work to do – it's not all just pressing buttons and relying solely on the machine to do all the work.

There are naturally some drawbacks to the system, one major concern being that some operators may become overly dependent on AIS, and therefore, may treat the system as a sole or primary means for vessel identification. This can be a fatal mistake, especially when one considers that AIS has the same vulnerabilities as VHF-FM, and has a propensity to cull transmissions when it reaches its saturation point (maximum number of transmission receipts), so just when you need it most, in heavy traffic, it may not be providing the full picture – the old lesson remains, and we must never rely on scanty information.

Other weaknesses to be guarded against include poor installation, incorrect data, poor displays (MKDs), and officers not switching units on/off as appropriate.

There are also important issues related to the development of electronic aids to navigation, and The Nautical Institute has long stressed the difficulties of dealing with technology, such as AIS, before it is fully developed and realised. We have also stressed the absolute need for proper training long before crews are expected to use such equipment.

The correct equipment used to its full potential by fully trained individuals can have a positive effect on the passage planning, voyage monitoring and safe conduct of the vessel. Small problems though, can quickly become very big problems if the equipment is not used properly and if it is not maintained correctly.

Equipment needs always to reflect the needs not just of the company, and the vessel – but also the people using it. So providers must stay aware of the operational demands, the design, ergonomics and must ensure that any equipment is truly fit-for-purpose.

In general, The Nautical Institute has found that mariners really do like AIS, as it improves situational awareness and provides positive and effective identification of targets. The days of the “ship on my port bow” VHF chatter are now over, and this is significant progress.

The Nautical Institute's Technical Committee has long been involved in the collation of reports from faulty AIS units, and the aim of this initiative has been to identify problems, improve installation and ultimately to improve the technology through design and regulation. AIS users are requested to report any AIS problems to ais@nautinst.org

As the professional body for those in command of seagoing craft, the Nautical Institute supports, recognises and embraces the importance of advances such as AIS, we also applaud the efforts of Lloyd's MIU in working to bring this system to its full potential, and thank them for giving us this chance to put the views of our members, the seafarers, across.

For more details of the work of the Nautical Institute, or to enquire about membership please visit our website, www.nautinst.org

LLOYD'S
MARITIME ATLAS
OF WORLD PORTS AND SHIPPING PLACES

This is the 24th edition of the Lloyd's Maritime Atlas, the premier reference guide to the world's ports and shipping places.

Fully updated and revised to reflect changes in port and country names and international borders, the latest edition is again supplemented with a FREE CD Rom, which gives the book enhanced portability. In this edition, 225 port places have been added to the geographical index.

The Atlas provides precise latitude and longitude co-ordinates, details of the main canals and river systems, weather conditions, load line zones, international airports, plus details on principal road and rail connections. In addition, the Atlas features world and regional marine distance tables, a comprehensive user guide and detailed statistics on commercial vessel movements, characteristics and casualties.

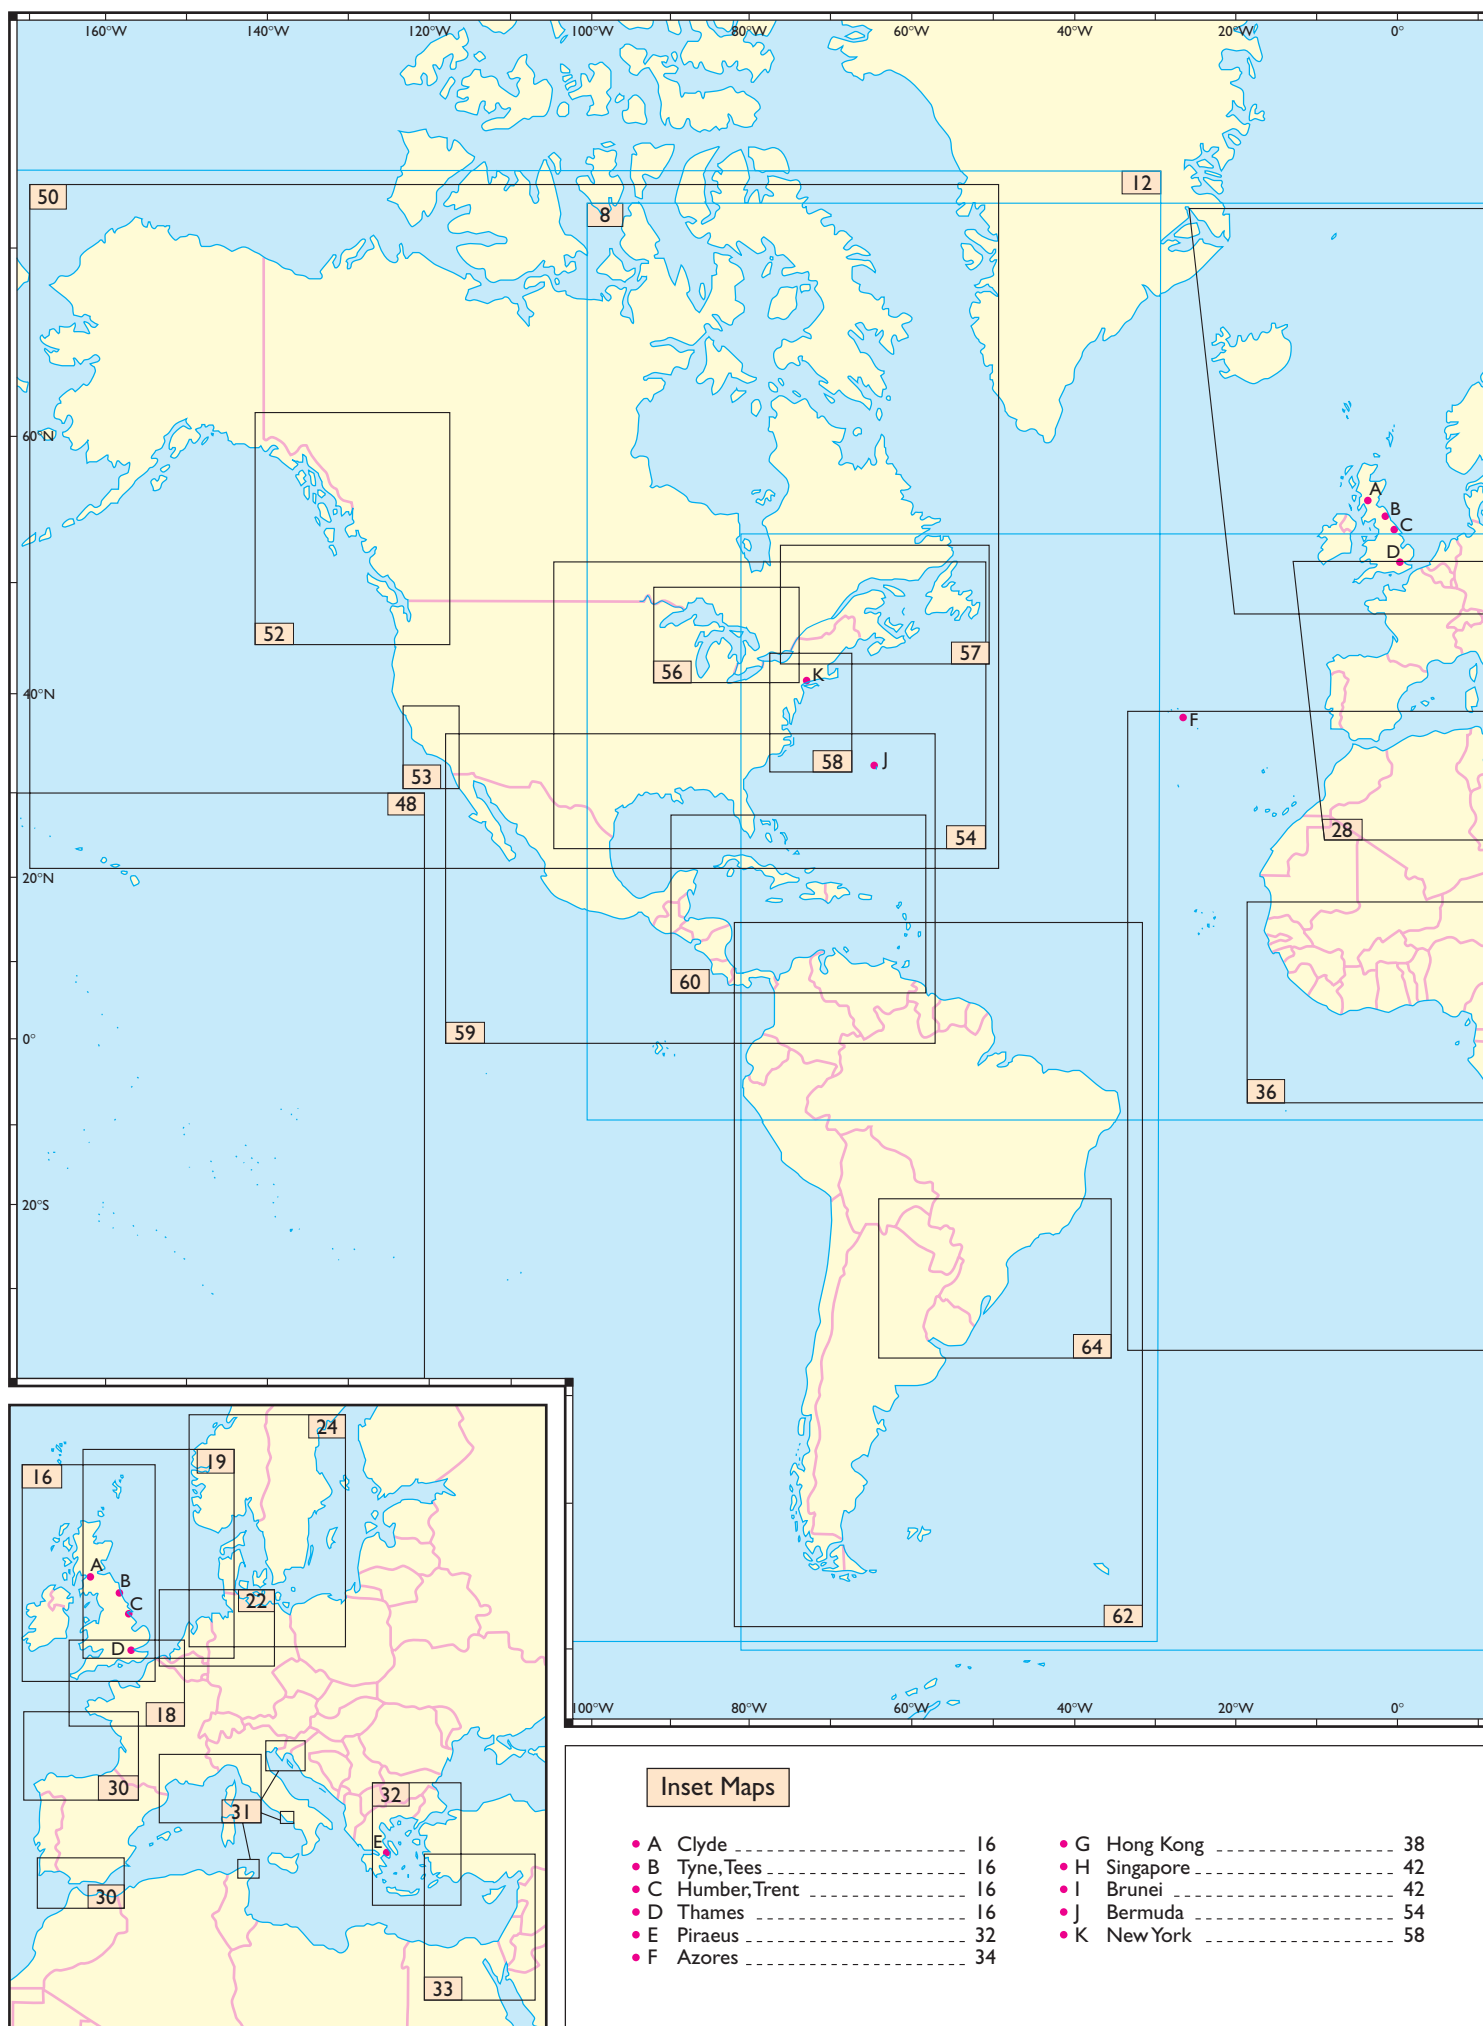

Featuring world maps, regional maps and larger scale maps for the busiest shipping areas, the book also encompasses a unique indexing system which allows users to search for ports on both a geographical and alphabetical basis. The use of full colour throughout adds to the user friendliness of the Atlas.

The Atlas is designed to be used in conjunction with the Lloyd's List Ports of the World annual publication. By cross referencing between the two books, users can glean full details on cargo-handling facilities and services provided at all the major ports and shipping centres across the globe.

As a group, Lloyd's MIU is always looking for ways in which its products and services can be improved and we welcome any comments and suggestions that you may have concerning this Atlas or any of our other publications. To contact us, please send an e-mail to enquiries@lloydsmiu.com

KIEL CANAL

65

Suez Canal

The Suez Canal connects the Mediterranean Sea and the Red Sea and extends for a total length of 101 miles (162km). The Mediterranean entrance is situated at Port Said and the Red Sea entrance at Port Tewfik.

There is no restriction on the length of a vessel, max beam is 70.1m and max draught is 17.68m. These dimensions can vary as the Canal Authority operates a breadth and draught table. The Canal is dredged to a depth of 25m.

The Canal operates a lock-free transit system with passage by convoy, 2 southbound and 1 northbound daily, max 40 vessels per convoy except the 2nd southbound convoy which has a maximum of 15 vessels. The average transit time for the southbound convoy is 14 hours and for the northbound is 10 hours.

There are three crossing points under construction at present. A bridge over the Canal at Km48, a railway bridge also over the Canal at Km64 and a tunnel under the Canal called Ahmed Hamdi close to El Shallufa.

Canal Authority :

Suez Canal Authority, Pilotage Building,
Ismailia, Egypt
Tel : +20 64 910000
Fax : +20 64 914784
E-mail : scanalb@idsc-net.eg

Panama Canal

The Panama Canal connects the Atlantic Ocean and Pacific Ocean, running NW to SE from Cristobal on the Atlantic coast to Balboa on the Pacific coast for a distance of 51 miles (82km). Vessels transiting the canal are raised and lowered 26.2m from sea level to sea level by three sets of locks. These are Gatun locks, Pedro Miguel locks and Miraflores locks. Average transit time is 9 hours.

Maximum dimensions of vessels ; max draught 12.04m, max beam 32.31m, max loa 289.56m for most commercial vessels and 294.13m for passenger and container vessels. These are overall maximums and certain vessel types may have individual restrictions of less than the above.
