IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Jul 22nd, 2026		CFR Qingdao, USD/dry tonne							Today, the DCE iron ore futures weakened today. The most-traded DCE 12609 contract closed at 739.5 yuan/mt, down 1.00%. The spot price at Qingdao Port fell around 4-8 yuan/mt from the previous trading day. Traders showed moderate enthusiasm in offering prices, while steel mills remained largely on the sidelines. As of now, spot trading volumes were moderate. According to this week's SMM survey, the capacity utilization rate of blast furnaces at sampled steel mills was 89.49%, down 0.50 percentage point WoW. Daily average hot metal production at sampled steel mills was 2.4247 million mt, down 13,500 mt WoW. Although this round of environmental protection-driven production restrictions was weaker than expected, hot metal production is expected to continue its downward trend. Meanwhile, environmental and safety inspection factors have not yet dissipated, and some steel mills may have temporary maintenance plans. Overall, blast furnace hot metal production is likely to keep declining in the short term, and iron ore demand is expected to remain weak. Therefore, iron ore prices are expected to consolidate with a bearish bias in the short term

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
