IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Aug 11th, 2026		CFR Qingdao, USD/dry tonne							Today, the iron ore market showed a relatively strong performance on the futures market. The DCE main contract 12609 closed at 721.5 yuan/ton, up 1.26% from the previous trading session. Spot prices at Qingdao Port rose by an average of about 3-6 yuan/ton from the previous trading day. Traders were generally active in quoting prices in line with market conditions, while steel mills purchased according to their needs, with overall spot trading volume remaining moderate so far. In the short term, changes in the fundamental supply-demand balance of iron ore itself are relatively small, though there is an expectation of a modest uptick in demand. According to SMM statistics, the hot metal impact volume from blast furnace maintenance this week is 3.4027 million tons, down 34,400 tons from last week's maintenance impact. Next week, the hot metal impact volume is expected to be 1.3498 million tons, down 55,900 tons from this week. At the same time, coke and coking coal futures performed strongly today, with market sentiment turning optimistic toward the ferrous metals complex, which in turn boosted iron ore futures prices in tandem. Based on a comprehensive assessment, iron ore prices are likely to continue their range-bound fluctuation with a modest upward bias in the short term.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
