IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Aug 12th, 2026		CFR Qingdao, USD/dry tonne							Today, the iron ore futures moved steadily today. The most-traded DCE I2609 contract closed at 720.5 yuan/mt, up 0.14% from the previous session. Spot prices at Qingdao Port fell by 0-2 yuan/mt from the previous trading day. Traders mostly priced based on market conditions, while steel mills' mainly procured on a rigid demand basis, leaving total spot volumes relatively low so far. Iron ore demand support weakened slightly this week. SMM data showed the blast furnace operating rate across 242 steel mills at 88.91%, down 0.13 percentage points WoW. The sample mills' daily average hot metal output was 2,400.5 million mt, down 5,300 mt WoW. On the news front, rumors remain frequent and hard to verify. The market focused on progress in long-term contract negotiations with mines, with most funds staying on the sidelines awaiting further confirmation of direction. Overall, ore prices may continue to consolidate in the near term, but iron ore's own fundamentals currently cannot drive a trending move, leaving the overall market still dependent on news-driven catalysts.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
