Iron ore futures traded firmer today. The DCE most-active contract 12701 settled at RMB 712/mt, up 0.76% from the previous trading day. Spot prices at Qingdao Port declined by RMB 2-3/mt. Traders were reasonably active in offering, but mill purchases remained largely restocking on a just-in-time basis, leaving overall spot transactions fairly subdued.

According to SMM research data, the blast furnace capacity utilisation rate across the 242 sample steel mills stood at 88.84% this period, up 0.24 percentage points week-on-week. Average daily pig iron output came in at 2.4069 million mt, up 6,400 mt week-on-week – a modest rebound after two consecutive weeks of decline, lending phased support to iron ore prices on the demand side.

In terms of market structure, demand for medium- and low-grade ore is already showing signs of picking up. That said, against a backdrop of rising coking coal and coke prices, mills' raw material procurement costs have moved higher and their acceptance of high-priced iron ore remains limited. On balance, iron ore prices are expected to maintain a rangebound pattern in the near term.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
