IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Sep 1st, 2026		CFR Qingdao, USD/dry tonne							Iron ore futures consolidated on a strong note today. The most-traded DCE 12701 contract closed at 726.5 yuan/mt, up 0.14% from the previous trading day. Spot prices at Qingdao Port rose by 1-2 yuan/mt overall, with steel mills mostly purchasing as needed. Traders showed moderate quoting enthusiasm, largely following market trends. Overall spot trading activity was moderate. From a fundamental perspective, supply side, port arrivals of iron ore fell by about 26% WoW recently due to typhoon disruptions, providing some short-term support for ore prices. Demand side, SMM survey results show that the daily average hot metal production in September is expected to edge up by 23,000 mt MoM. However, given that coke prices have been rising and squeezing steel mill profits, some blast furnaces originally scheduled to resume production may extend maintenance. Overall, iron ore demand growth is expected to remain mild, with peak-season demand characteristics not yet evident. As such, iron ore prices are likely to consolidate on a strong note in the short term.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
